

RehabAngel®

“An unique variable incline device that gives greater control and safety for patients requiring lower limb exercises.”

Neil Frame, NHS Specialist Podiatrist in Biomechanics
Inventor of the RehabAngel®

East Cheshire 
NHS Trust

Multiple treatments using a variety of devices have been recommended with various degrees of success for Plantar Fasciitis. Conservative modalities used to treat such conditions have been highly costly to services. Even with appropriate treatment the condition could become chronic; leading to surgery that has its complications. However, recently it has been identified that the increasing flexibility due to lower limb stretching can decrease the need for foot surgery and significantly reduces the number of failed or serial surgical procedures.

The RehabAngel® is an evidence based variable incline device which has a flat and 5 degree inverting wedged surface. Providing a simple solution to the problem.

Benefits to using the RehabAngel®:

- Reduces the level of stress on the ankle joints.
- Meets all health and safety and best infection prevention practices.
- Suitable for use in both sports, acute and community healthcare environments.
- Provides a controlled graduated rehabilitation environment for squatting and stretching tasks.
- Offers greater patient safety.
- Convenient to store and carry.
